MARCH 2026

YOVU.ca Website Brief

Insurance-first positioning for YOVU, YOVU Communications Platform, and YOVU Communicator

What this updated brief is designed to do

- Reposition YOVU from basic office-phone language to a workflow-driven communications platform story.
- Lead with insurance brokerages, Applied Epic, and YOVU Communicator without pushing non-insurance buyers away.
- Translate the current Communicator feature set and roadmap into a launch-ready website architecture and claim set.

This brief guides site architecture, product naming, launch-page scope, content direction, claim guardrails, and conversion design for a new YOVU.ca.

1. Executive summary

The new YOVU website should reposition the business away from generic 'office phone' language and toward a workflow-driven communications platform story that leads with insurance brokerages. The website should make Applied Epic and YOVU Communicator the clearest proof of that value.

Insurance should be the dominant GTM lens on the public site because it is where YOVU has the strongest workflow fit, proof, and differentiation. At the same time, the site should keep non-insurance buyers engaged by presenting YOVU as a flexible communications platform for any client-service organization that works inside a CRM, BMS, or browser-based operating system.

This updated brief incorporates the clarified product strategy, the current YOVU Communicator capabilities, the latest user-interface screenshots, the Epic persona workflow planning PDF, and the H1/H2 roadmap guidance supplied by YOVU.

2. Strategic direction at a glance

- Lead with insurance outcomes, not generic telecom features.
- Retire 'YOVU Office Phone' from primary messaging and replace it with a clearer product hierarchy.
- Make YOVU Communicator the hero product experience because it is the most differentiated story.
- Use Applied Epic as the flagship integration page and proof-of-value narrative.
- Break insurance messaging into overview + Personal Lines + Commercial Lines, with supporting cross-brokerage pages for Reception, Leaders/Ops, and IT/Admin.
- Keep a visible 'Beyond Insurance' path so non-insurance buyers know YOVU still fits them.
- Treat roadmap items carefully: useful for future page planning, but not launch hero claims.

3. Recommended product naming architecture

The public site should replace the limiting 'YOVU Office Phone' language with a broader product hierarchy that can support insurance, integrations, and future platform expansion.

Level	Recommended public name	Role on the website	Notes
Company brand	YOVU	Parent brand used across the site	Simple, broad, and future-proof.
Core offer	YOVU Communications Platform	The parent product story for calling, routing, mobile, recordings, reporting, and integrations	Use this instead of 'YOVU Office Phone' in headlines and navigation.
Embedded workflow product	YOVU Communicator	The signature interface inside Applied Epic and browser-based workflows	This should be the website's most visible product name.
Endpoint apps	YOVU Mobile, YOVU Browser Extension, and any approved desktop app labels	Supporting products and form factors	Lead with the browser-extension / embedded-workflow story because that is the clearest current differentiator.
Industry solution	YOVU for Insurance Brokerages	The insurance solution umbrella	Used for solution pages and campaigns rather than as a product name.
Legacy SEO term	YOVU Office Phone	Hidden or secondary SEO / redirect term only	Keep only where needed for search continuity; do not place it

			in primary navigation.

4. Messaging pillars

Pillar	What the site should communicate
Work where your team already works	YOVU Communicator lives inside Applied Epic and other browser-based workflows, so staff do not need to keep switching systems to answer, review, and log calls.
Turn conversations into usable workflow data	Calls should not disappear after they end. YOVU captures recordings, transcripts, summaries, sentiment, and related activity so teams can act on them later.
Give every role the right context faster	Screen pop, searchable history, click-to-call, directory presence, and workflow-aware logging help each person respond with more confidence.
Strengthen documentation and operational control	Brokerages get a better communication history, stronger E&O support, easier issue review, and better management visibility.
Stay human and high-support	YOVU should keep its Canadian support advantage and sound like a practical partner, not a faceless telecom catalogue.

5. What is live today versus what stays out of launch copy

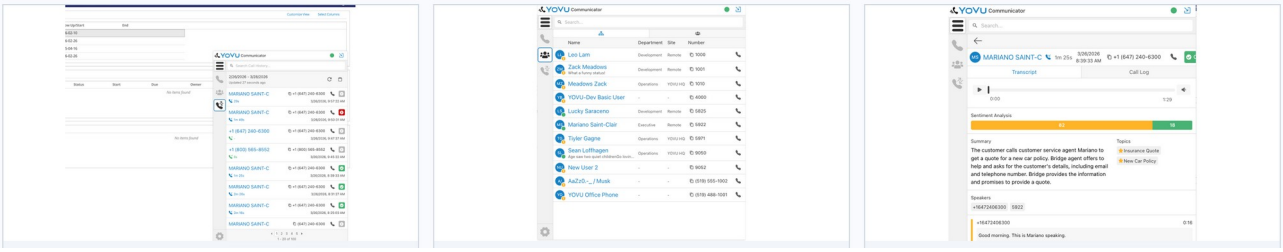
The website should be built around what sales can show confidently in a demo today. Roadmap items matter for future planning, but they should not blur the launch message.

Capability or claim area	Public status	How to use it on the website
Core cloud calling / routing / YOVU telephony platform	Live now	Safe for homepage, platform page, and general product messaging.
YOVU Communicator as an embedded browser-based workspace inside Epic and browser-based CRMs/BMS	Live now	Lead with this across homepage, Communicator, and Applied Epic pages.
Full call control inside Communicator	Live now	Safe to feature in product sections and screenshots.
Call recording pause / resume	Live now	Use in Communicator and compliance copy; keep the wording practical.
Full transcription, AI summary, sentiment analysis, and topic summarization	Live now	Safe to highlight with proof screenshots and workflow outcomes.
Epic screen pop, click-to-call, and activity logging	Live now	Use heavily on Applied Epic and insurance pages.
Context-aware behavior based on the client and activity being viewed in Epic	Live now	Use as a differentiated workflow claim, especially on the Applied Epic page.
Floating, dockable, resizable interface that remembers user placement	Live now	Great for product-detail storytelling on the Communicator page.
Searchable call history, directory, presence, and status	Live now	Use on Communicator, Reception, and Leadership pages.
Reception-style transfer and conference controls	Live now	Feature on Reception & Front Desk and Communicator pages.

Mobile call continuity back into Epic through transcript/record review	Live now	Use on Communicator, Applied Epic, and Commercial Lines pages.
Salesforce integration and browser-based click-to-call story	Public day-one secondary integration story	Mention on Integrations, Platform, and Beyond Insurance pages; do not give it the lead role over Applied Epic.
7-year retention plus role-based access controls	Public-safe with careful wording	Use for documentation and compliance support language, but avoid 'guaranteed compliance' claims.
Windows/Mac app labels and any unconfirmed endpoints	Needs product confirmation	Do not lead with them until current GA status is confirmed.
AI Receptionist, SMS/chat, SSO, Netsuite activity logging, preferred-agent routing, and other H2 roadmap items	Roadmap	Exclude from launch hero copy and launch feature grids. At most, mention selected items in a restrained 'coming soon' context if commercially useful.

Current YOVU Communicator interface

Representative screenshots supplied by YOVU for website planning and proof-of-value storytelling.



Representative interface proof supplied by YOVU: Communicator floating inside Applied Epic, directory/presence view, and transcription/sentiment view.

6. Insurance audience strategy

- Launch one top-level Insurance Brokerages page, then break the story into separate Personal Lines and Commercial Lines pages.
- Use cross-brokerage role pages for Reception & Front Desk, Agency Leaders & Operations, and IT & Admin because those roles cut across Personal and Commercial equally well.
- Keep producers, service teams, and claims workflows visible inside Personal Lines and Commercial Lines sections, rather than exploding launch scope into too many narrow pages.
- Preserve a Beyond Insurance page in the main navigation so non-insurance visitors do not self-disqualify.

7. Website benchmark review

The new site should borrow clarity and structure from larger platform players while keeping the specificity that insurance buyers expect from workflow-focused vendors.

Site reviewed	What to borrow	What YOVU should do differently
Current YOVU site	Canadian support story, integration proof, and the existing insurance page's brokerage-specific language.	The homepage still leads too heavily with generic VoIP and broad small-business positioning.
RingCentral	Clear platform hierarchy, modular product families, proof metrics, reliability claims, and consistent CTA placement.	YOVU should be less enterprise-generic and more workflow-specific.

Zoom Contact Center	Context-preservation language, AI routing concepts, and the idea of connected journeys rather than disconnected channels.	YOVU should keep the story grounded in actual workflows and screenshots, not abstract CX language.
Five9	Outcome-led CX and operations language, plus management visibility and insight framing.	YOVU should stay simpler and more applied to brokerage operations.
Lightspeed Voice Applied Epic page	Specific Applied Epic workflow bullets, AI plus logging story, and a very clear demo CTA.	YOVU should match the specificity but present a cleaner, more modern brand and product architecture.
blueC / blueButler	E&O protection framing, automated activity creation, screen pop, management oversight, and audit-trail language.	YOVU should avoid feeling old-school or overly dense while preserving this specificity.

8. Roadmap implications for future content

The supplied H1 and H2 roadmap materials are useful for future page planning and campaign sequencing, but they should stay separated from the launch claim set.

Roadmap bucket	Examples from supplied roadmap	Website implication
H1 2026 themes	Transfer enhancements, directory UI/presence, queue log in/out, voicemail controls, WebRTC UI, enhanced Epic screen pop and activity logging, activity-log reporting groundwork, translation POC, DND reporting, voicemail drop, audio signatures.	Use only for future planning. Do not create launch copy that implies all of these are already generally available.
H2 2026 themes	AI receptionist / call triage, SMS & chat, preferred-agent routing, Microsoft and Google SSO, Microsoft Teams presence, Salesforce Service Cloud Voice UI and activity logging, Netsuite activity logging, Epic SMS activity logging.	Helpful for roadmap and investor/customer conversations, but not for launch hero claims. A minimal 'what's next' teaser is the most that should appear publicly at launch.

9. Recommended launch sitemap

This page set supports an insurance-first GTM motion while keeping a clear platform story and a path for non-insurance demand.

Page	Why it exists	Key content focus	Primary CTA
Home	Reposition YOVU from a generic phone-system provider to an insurance-first communications platform and drive demo requests.	Insurance-first hero, pains/outcomes, product stack, persona paths, Beyond Insurance invitation.	Book a brokerage demo
YOVU Communications Platform	Show that YOVU is more than a phone system and provide the parent product story above individual integrations or industry pages.	Parent product story, modular capabilities, workflow platform positioning.	See the platform live
YOVU Communicator	Make YOVU Communicator the centerpiece of the website and clearly explain what it is, where it	Embedded interface, screenshots, AI/transcript value, call control, reception mode, mobile continuity.	See YOVU Communicator live

	lives, and why it changes daily work.		
Insurance Brokerages	Provide the top-level insurance solution page that frames YOVU as built for brokerage communication and documentation needs.	Brokerage problem framing, Applied Epic story, role navigation, documentation value.	Book a brokerage demo
Applied Epic Integration	Win the highest-intent insurance search and sales conversations with a dedicated Applied Epic landing page.	Epic-specific click-to-call, screen pop, activity logging, history, playback, AI proof.	Book an Applied Epic demo
Personal Lines	Show how YOVU helps high-volume personal-lines teams move faster, reduce manual work, and document every client touchpoint.	High-volume new business, servicing, renewals, claims-support context.	See the personal-lines workflow
Commercial Lines	Show how YOVU supports longer, more complex commercial-lines workflows with stronger context, easier handoffs, and better documentation.	Complex accounts, producer/service coordination, mobile continuity, documentation depth.	See the commercial-lines workflow
Reception & Front Desk	Show how YOVU improves main-line answering, caller identification, routing, and transfer quality.	Directory, routing, transfer, caller ID/context, fewer wrong handoffs.	See reception in action
Agency Leaders & Operations	Connect YOVU to visibility, coaching, service consistency, and documentation control.	Oversight, recordings, searchable history, coaching, documentation confidence.	Talk to a specialist
IT & Admin	Reduce perceived implementation risk and answer technical/deployment questions in business-friendly language.	Deployment, controls, integration posture, support model.	Discuss implementation
Integrations	Show that YOVU is integration-led and that Communicator can work inside existing browser-based workflows.	Applied Epic first, Salesforce second, browser-based CRM/BMS workflow fit.	Explore Applied Epic
Beyond Insurance	Preserve broader demand without weakening the insurance-first story on the rest of the site.	Non-insurance fit, use-case language, flexible workflow story.	Talk about your workflow
Customer Stories	Reduce risk by showing brokerage proof first and broader customer proof second.	Brokerage proof first, broader proof second.	Book a demo
Security & Compliance	Answer risk and recordkeeping questions without sounding like a legal disclaimer page.	Retention, RBAC, defensible documentation language, safe claims.	Request security details
Support & Onboarding	Show that YOVU is a partner with a hands-on implementation and support model, not just a software vendor.	Rollout, role-based training, long-term support.	Start with confidence
About YOVU	Retain the Canadian support and service story while modernizing the company narrative around workflow-driven communication.	Canadian support story, company values, future-facing product evolution.	Talk to YOVU
Resources	Support search, education, and sales enablement with practical content.	Guides, articles, integration explainers, webinars, nurture.	Explore resources

Book a Demo / Get a Quote	Convert demand with a role- and workflow-aware form experience.	Workflow-aware form, reassurance, insurance vs non-insurance routing.	Submit the form

10. Navigation model

Top navigation	Recommended structure
Product	YOVU Communications Platform | YOVU Communicator | Integrations
Solutions	Insurance Brokerages | Personal Lines | Commercial Lines | Reception & Front Desk | Agency Leaders & Operations | IT & Admin | Beyond Insurance
Proof & education	Customer Stories | Resources | About YOVU | Support & Onboarding
Primary CTA	Book a Demo
Secondary nav / footer only	Legacy YOVU Office Phone SEO page, legal pages, privacy, terms, accessibility, thank-you pages, article and case-study templates

11. Public-claim guardrails

Retention and compliance language can be strong, but the website should avoid absolute legal claims or terminology that suggests regulatory certification without explicit review.

Theme	Recommended public-safe language	Avoid until fully validated
Compliance/E&O	Helps strengthen E&O documentation and create a more defensible communication history.	Guaranteed compliance, regulator-approved, or zero-risk statements.
Retention	Retains call recordings for 7 years and ties related records back to the client workflow.	Absolute legal claims that imply every retention or regulatory scenario is covered automatically.
Access control	Role-based access controls help protect who can view or remove records.	Unqualified 'tamper-proof' language unless product and legal teams explicitly approve it.
AI	AI summaries, transcription, sentiment, and topic analysis help teams review calls faster and follow up with better context.	Claims that AI replaces judgment, coverage decisions, or compliance obligations.

12. Design and UX direction

- Use a cleaner, more modular system similar to RingCentral, Zoom, and Five9: strong hero hierarchy, restrained card system, repeated trust proof, and consistent CTA placement.
- Pair that polish with the insurance-specific workflow detail seen on Lightspeed and blueC, but present it in a simpler, more visual, more modern brand system.
- Use real product screenshots wherever possible—especially Communicator inside Applied Epic, the directory view, and the transcript/summary view.
- Favor workflow diagrams, process strips, and UI-in-context over generic stock photos.

- Keep the site visibly 'insurance-first' without writing off other industries. A simple Beyond Insurance section on the homepage and a dedicated industries page is enough.
- Do not let roadmap slides drive launch page clutter. Launch pages should look current, grounded, and immediately demo-able.

13. Conversion strategy

- Primary CTAs: Book a brokerage demo | See YOVU Communicator live | Explore Applied Epic | Talk to a specialist.
- Use a single conversion flow with smart routing for insurance versus non-insurance visitors.
- Ask for only the information sales actually needs: company, role, current system, team size, top workflow pain, and timing.
- Use proof close to every CTA: broker logos, short quotes, Canadian support, and workflow outcomes.
- De-emphasize commodity pricing-page behavior at launch. Insurance buyers should be guided toward tailored demos and tailored quotes, not a generic seat-price comparison table.

14. Content and proof assets required before design

- Approved product screenshots of Communicator inside Applied Epic, directory/presence, transcript/summary view, and reception workflow.
- Brokerage logos, customer names, and permissions for testimonial use.
- Approved support and infrastructure proof points that will still be true at launch.
- One simple product architecture diagram showing YOVU, YOVU Communications Platform, YOVU Communicator, and YOVU Mobile.
- One simple workflow diagram for Personal Lines and one for Commercial Lines.
- A compliance/legal sign-off on final public language around retention, E&O support, and access controls.
- A short, approved 'what is live vs roadmap' internal truth sheet for the content and sales teams.

15. Recommended next steps

- Approve the naming architecture and replace primary 'YOVU Office Phone' language with the new hierarchy.
- Approve the launch sitemap and the decision to separate Personal Lines and Commercial Lines.
- Lock the live-now claim set for Communicator, Applied Epic, AI features, mobile continuity, and compliance wording.
- Create low-fidelity wireframes for Home, YOVU Communicator, Insurance Brokerages, and Applied Epic first.
- Review and approve the page-copy pack page by page before visual design begins.
- Keep a separate internal roadmap-to-website list so future features can be added deliberately, not prematurely.

16. Source note

Reference inputs used for this brief: current YOVU homepage, insurance page, and about page; current RingCentral, Zoom, and Five9 platform/industry pages; insurance-specific Applied Epic and AMS/BMS workflow pages from Lightspeed Voice and blueC; the YOVU Communicator deck; the Epic workflow planning PDF; and the updated product and roadmap notes supplied by YOVU.
